

Energy Trading

As a plant operator or direct marketer, real-time generation data is essential to operate plants competitively. With acteno energy metering & energy performance management, plant operators have all feeders constantly in view and can use the real-time data to support fault management and direct marketing. This is important to reduce yield losses and to ensure the economic and long-lasting operation of the plants. Structured plant information, carefully prepared with real-time data, allows users to quickly see at any time how individual plants or entire parks are performing.

For direct marketing, the measurement data collected in real time can be used to support forecasts and reduce risks in the sale of energy volumes.

With acteno energy all plants and parks are in sight

- Smart metering with Acteno energy : measuring point operation and metering services
- Market communication according to MSCONS
- Energy data in real time
- Notification in the event of irregularities
- Support of forecasting systems
- Analysis & Reports
- All plants & energy data at a glance
- Export to third-party systems
