

Individual Measurement Concepts

Acteno energy offers an economically optimized application, combination and integration of decentralized generators, storage systems and consumers.

Efficiency stems from an optimization of purchase and usage, through the setting up of an intelligent measurement concept. Individual solutions and additional revenue potentials as well as legal and technical fundamentals will be considered.

- consideration of the individual system configuration
- coordination with network operators
- inclusion of legal advice and auditing on demand
- Consideration of individual needs

Through mathematical relationships between the time series there is a dynamic, profitable and cost-effective allocation of the amounts of energy corresponding to the given market / network situation.

Acteno energy smart metering concepts enable the dynamic realization of

- new relationships between market participants
- profit-maximizing marketing potential
- optimized purchase and supply situations
- intelligent supply concepts with inclusion of storing controllable loads and generation capacity

What we offer

1. Selection (?) and analysis of the initial situation by taking into account technical, legal and commercial conditions.
2. Preparing a solution for the required measurement concept
3. Simulation & Evaluation

4. Coordination with network operators , suppliers , plant operators and auditors
5. Installation of measuring systems and if required, integration with the local control technology
